

Ordered 5 yards of Black Fiberglass

Looks like Carbon Fiber

Template of material to be installed

Material being put in place

Black fiberglass with resin installed.

## Getting Turn-signal lights mounted

All I did was make a Flat piece for the light to have a resting place. Will also bolt to fiberglass.

This is a better shot. Tomorrow (Sunday) I will be installing the fog lights! Can't wait to take a picture of that front end! I figured by advancing into installing those lights would give me a better view of what I'm almost ready to be driving on the road! Gives me tons of motivation points!!! As far as engine I will be

doing a Toyota supra inline 6cyl turbocharged. I have a friend making over 800wheel hp!! So I will send you pictures as soon as I get a hold of my engine. He can also make me the adapter plate for transaxle. I'm happy he's helping me with the building of engine/transaxle...that's a Plus! Today he had it on the dyno and it put down 754 whp, 688 wtorque!!! It's very impressive! I was like Whoa! That's the engine I want in my Diabolic! More news to come. Have a Great Weekend.

I still need to finish up the body work. But here is a rough look at the finish product. As you can see I'm still working on the carbon fiber lower pieces. I'm making a mold next week to fabricate better looking pieces.
