

Just wanted to show you some of the templates I made. I spoke with Jeanine yesterday, wow we talked for about 20 min! Anyways, she did mention she was working on some glass kits made for your particular Diabolic bodies. But that sounds like a mess. Due to, they have to make new molds for the glass to be made. And the glass is fabricated in PERU!!! But they are working on it she said. My plan is: I am sending her these templates on Monday morning, and they will have the minimum measurements I can use on the Diabolic. If her glass is slightly bigger than my templates, I will order the entire glass kit. I found a place here in Dallas, TX. that will cut the glass using a water jet machine, which will reduce the chance of glass breaking during the cutting process. What do you think? Have a Great Weekend.

Here I cut out exactly the pattern of a windshield that would fit if the underside has same measurements as templates. Outside of glass has big curvature which will make it seem bigger in length. Underside is what bonds to vehicle. So underside is what we need to get correct. :)

Here I show the C-channel that holds glass inside the door, for measurement reference. We need the glass to be at least to the outside black line. The inside line is what you see when window is closed. I did 2 templates. The other one has measurements and notes.

Here are all the measurements, and notes on back of same paper.
