

While Fillipe was waiting for his purchase of the body kit, he was doing the modifying of his chassis to be used in the project.

The basic Fiero that most start with.

Removing the panels starts

With panels removed

Now the cutting begins

Once the unwanted chassis is cut away, Fellipe starts to weld on the modifications.

Then there was the exchange of the kit where we met in Flagstaff Arizona. Felipe mentions that the body will probably sit on the pallet for a while as the bank account builds back up.

The kit made it to Texas shop on the Body pallet, and that night the friends that plan on helping with the build say they want to have a planning party, so another sleepless night

The wait is too long. The shipping pallet is removed and the body is being fitted to the modified Fiero chassis within 5 days of receiving the kit.

Front view as the body is lowered on the chassis.

Making sure of clearance and proper fit.

The body is fully lowered on the chassis
