

I practiced on a few parts and I came up with my own way of making parts...I know it's not the correct way...but all I know is that after all the steps I take. The part looks real good and 0 air bubbles!!! I will be using the glasses holder and dome lights from a 2003 Nissan 350z, will show you pictures in a few min. I have a picture of a gray one. But will order a black one for my build.

Nissan 350X dome light to be used. but I need to find it in black plastic. I could paint it...but hate to see it peel.

Wow, you were not joking she. You said the doors are difficult. They do have a trick to them and I figured it out. So, should be ready in the next week or so. I did have to ask a few other guys that have more experience in the field. But this weekend I should have at least 1 door with moving glass! Check out the curvature of this glass! It's crazy....
