

# Diabolic Build For James C.

Body kit with parts on Body Pallet

Parts all safely tucked in body. Just rolling this body on the casters gets attention.

Parts strapped inside of body shell. Note front support arms. Same design for rear support arms, to minimize vibration and bounce on body during transporting.

Some paper and some bubble wrap around the parts.

This whole assembly weighs in at about 400 pounds. It is easily lifted by one individual on either end.

Note the side bumper rails (2" X 3" board) that extend 1 1/2" past body and keeps the body from hitting sides of freight vehicle. Tie-downs secured for the trip.

We have shipped these from California to So. Carolina, with a safe trip. This one is going to Michigan.
