

Fuel Cell with Mods

I just returned from a vacation down to Lake Jackson, TX. Talk about warm & dry!!! Enroute from Tulsa down to Lake Jackson, we stopped for a visit at Felipe Sanchez's home to check on his build. He is real busy at his shop right now but he took time to see me and get acquainted along with his father also. Very nice people. Like me, he is mixing his life enjoyments along with his build. People who do not enjoy life along with their builds are missing out. Making all of the decisions that come with a kitcar can be overwhelming at times. We must have balance and an upward look. Hope that you are all fine and doing well in your ministry (www.MovingOnMinistry.com).

NOTE: This family relationship that develops between builders is what this business is all about. There is never a case of who is right or which way is right or wrong to do something. Rather there is a bonding of individuals to accomplish the goal set before them, while enjoying the journey.

Here is a picture of my fuel cell. I had to relocate the filler neck and the fuel bypass fitting as they interfered with my structural tubing. Minor problem. All that remains with the fuel cell is the attachment framework and stone shield/heat shield and we should be ready for some fuel lines and fittings.

Now complete with custom fabricated mounting brackets. Jim always puts a lot of pride in his work (see the Lamborghini hinges he is producing for sale).
