

Installing the Taillights

For the installing of tail lights there are several choices. These vary according to expense, availability, and exactness wanted.

One option, usually the cheapest, is the use of 1984-1990 Corvette taillights.

This will make all taillights red and require separate backup lights.

Corvette also had lenses released for European use that were amber lenses. If these can be located, they are preferred to give a more authentic look.

The above picture is to see what the actual taillights look like, though these are mounted on a replica. Note the white/amber combination on the outside mounting.
